

“Re: Routine”: Developing Discipline for Busy Young Individuals

The Prompt to Guide Gemini Pro 3.1

Act as an expert market research analyst specializing in B2C productivity and gamification mobile applications. Analyze the top 5 competitors in the habit-tracking and gamified routine space: **Habitica, Finch, Forest, Routinery, and Streaks**. For each competitor, provide a structured breakdown covering:

- Core Features:** What are their primary mechanics for engagement and tracking?
- Target Audience:** Who are their primary user demographics and psychographics?
- Pricing Models:** What are their monetization mechanics (e.g., freemium tiers, subscription costs, in-app purchases)?
- Main User Complaints:** Synthesize 1-star to 3-star app store reviews and community forums to identify recurring pain points, UX friction, and feature deficiencies.

Conclude with a high-level synthesis highlighting market gaps where current solutions fail to adequately address user needs.

Competitor Insights Summary

Bad Features

Gamification relies heavily on high-stakes penalties or deep avatar management.

About Audience

Users are forced to choose either high-stress or low-velocity emotional support.

Pricing Models

Most apps use freemium subscription instead of one-time pay upfront.

Main User Complaints

Hard rigid systems wiping out progress by a missed day, feature bloat, bad UI/UX.

What Can “Re: Routine” Improve?

Core Features

Clean interface with instant gratification, progress points, and no penalty system

Target Audience

Busy young professionals (22–35) who needs a rewarding dopamine without heavy setup

Revenue

Keep habit-tracking free, and monetize through premium aesthetic upgrades

Unique Value

Deploy an AI “routine splitter” to automatically break down big goals into micro-checklists

Who Will Use “Re: Routine”?

People from **22 years old to 35 years** old with little to no time to setup discipline as they have things to do, yet need diversification in **routines** by prioritizing **dopamine** and **avoiding penalties**

Product Lifecycle Visualization

Where is “Re: Routine” Currently?

We are in the first quarter as it is still in **development**, user testing, optimization, and gathering data. The data can be used for A/B testing and is used to prove unique value’s worth. The growth phase is used for PDCA implementation and addressing new user complaints. After most of the complaints are addressed, “Re: Routine” focuses on stability. The last phase is when “all-in-one” AIs are far too advanced, thus making “Re: Routine” redundant.

Strategic Vision, Solution, and Implementation

Create a routine-tracking application for young adults with busy schedule by using reward system (gamified approach) and no penalty to ensure continuous discipline-building called “Re: Routine”. This application offers minimalist User Interfaces and User Experiences with free tracking and premium aesthetic upgrades. First quarter includes gathering user preferences, with the next phase consistently maintaining “Re: Routine”.

Third Party: Gemini Pro LLM

Implementing this API is technically required to power the app's core differentiator: the "AI routine splitter" that takes a user's broad goal (like "Get fit") and dynamically processes it into actionable micro-checklists. This directly supports the product's vision of providing "instant gratification" and removing the "heavy setup".

MoSCoW Prompt: Won't Have

Act as a ruthless Product Manager for 'Re: Routine'. Based on the main user complaints identified in our competitor analysis—specifically rigid systems that wipe out progress for missed days, deep avatar management, and general feature bloat—generate a strict 'Must Have' and 'Won't Have' feature list for our initial MVP.

Event Routing Database Validation

Event called “*ai_routine_breakdown_generated*” measures user adoption of "Re: Routine's" unique value proposition during the Introduction stage. If users are consistently triggering the AI to break down their tasks, it proves the core hypothesis and the existential meaning of “Re: Routine” works through A/B testing.

Extra Customization

To combat "avatar management" and avoid feature bloat, the MVP exclude customizable characters, ensuring the UI is clean and focused solely on progress points.

Penalty System

Purposefully lack any backend logic that punishes users or resets their score to zero, thus creating a 100% guilt-free experience so the users can focus on improving.
